rearrangement in a cell, or T cell response to T cell receptor
rearrangement in a cell, or T cell response to T cell receptor
stimulation. The method comprises contacting the cell or T cell with
a Fyb/SLAP complex modulator sufficient to modulate the formation
of a complex of an Ena/VASP protein and a Fyb/SLAP protein. The
method is useful for modulating cytoskeletal rearrangement in a cell
such as a lymphocyte, preferably a cell, a macrophage or a cell
fragment such as a platelet and for modulating T cell response to a cell
response is increased in a subject
response is increased in a subject
response is inhibited in a subject having or is at risk of developing in a cutoimmune disease or a condition characterized by inflammation. A
composition comprising a Fyb/SLAP complex inhibitor is useful for
increasing platelet aggregation for promoting wound healing or
The present sequence represents a Fyb/SLAP complex inhibitor. Fyb/SLAP proteins are ligands for the EVH1 domains of Ena(enabled)/vasodilator-stimulated phosphoprotein (VASP) proteins. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Dp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of preventing mammalian cell migration, comprising inducing a functional Ena(enabled)/vasodilator-stimulated phosphoprotein (VASP) or promoting cell migration comprising depleting functional Ena/VASP protein in the mammalian cell. The method is useful for promoting mammalian cell migration, preferably tumour cell migration in vitro or in vivo and to prevent tumour cell metastasis in a subject. An Ena/VASP activator or Inhibitor is useful for promoting wound healing preferably fibroblasts or nerve cells of a tissue type with the inhibitor to promote actin polymerisation and tissue formation on a scaffold. The inhibitor is also useful for preventing neurodegeneration such as in Alzheimer's disease, Down Syndrome, Parkinson's disease, amyotrophic lateral sclerosis (ALS), stroke, direct trauma, Hunthigton's disease, epilepsy, ALS-Parkinsonism-dementia complex, progressive supranuclear palsy, progressive bulbar palsy, spinomuscular atrophy, cerebral amyloidosis, pick's atrophy, Retts cereblar degeneration, Tourettes syndrome. The Ena/VASP inhibitor is further useful for enhancing learning and memory in a subject having or at risk of developing a learning disorder such as halzheimer's disease, Creutzfeldt-Jakob disease, Drain dage-related memory loss. The inhibitor is subject having or at risk of developing a learning disorder such as subject having or at lisk of developing a learning and memory in a subject having or at lisk of developing a learning and memory is synapse. Ena/VASP activator is useful for disrupting the activity of Ena/VASP protein and the activator is administered in an amount to promote Ena/VASP protein the activator is administered in an amount to promote Ena/VASP cancer na disparte and this is useful for treating and preventing inflammatory disorders such as arthritis, allergy, gout, organ transplant, and isolates to proper propered in an amount dispared in a minimal disorder such as arthritis, allergy, gout, organ transplant, metastasser and energy account organ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          astasis. The present sequence represents the amino acid sequence Ena/VASP homology (EVH) proline-rich motif #1.

                                                                          for the novel peptidase of the invention. The peptidase hydrolyses p-p-p, and p-P and recognises the proline at the second residue from the N-terminal of peptide to release the N-terminal amino acid. The enzyme's activity is stimulated with Mncl2 and inhibited with o-phenanthroline and 2-mercaptoethanol. The peptidase is useful for the hydrolysis of proline containing physiologically active peptides, oligoproline and proline rich proteins in the living body, particularly in the brain of mammals. The peptidase is useful for the prevention and treatment of proline rich protein related diseases and study of cerebral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences represented by AAR80046 and AAR80048-R80059 are substrates for the novel peptidase of the invention. The peptidase hydrolyses P-P-P-P. P-P-P, and P-P and recognises the proline at the second residue from the N-terminal of a peptide to release the N-terminal amino acid. The enzyme's activity is stimulated with MnCl2 and inhibited with co-phenanthroline and 2-mercaptoethanol. The peptidase is useful for the hydrolysis of proline containing physiologically active peptides,

Initially a first 'monomer' (nucleotide or amino acid) is bound to synthesis sites (through a tether molecule). Using a series of masking steps, a second monomer is added to the first and also to new synthesis sites (i.e. bound to the carrier as well as in addition to the first monomer). This is repeated to obtain a series of polymers
oligoproline and proline rich proteins in the living body, particularly in the brain of mammals. The peptidase is useful for the prevention and treatment of proline rich protein related diseases and study of cerebral
                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cyclic nucleic acid and polypeptide arrays - useful for determining binding characteristics of a specific molecule to variations of the nucleic acid or polypeptide in the array
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              benzotriazol-1-yloxytris-(dimethylamino)
phosphonium hexafluorophosphate (BOP)"
                                                                                                                                                                                                                                                                                                                                                                                  ;

WBP-1 (AAR97695) and WBP-2 (AAR97696) are ligands for the WW signalling domain of human Yes proto-oncogene associated protein, YAP (AAR97670). The PY motif is involved in binding the WBP2 to the WW domain. It does not conform to the consensus of SH3-binding proline-rich domains, but appears to require a different consensus (AAR97693) sequence for binding. Residues surrounding the PY motif may impart specificity for a particular WW domain. Mutagenesis of any of the residues of the motif (see AAR97698-700 and AAR98322-23) abolished or

Peptides containing this residue have been shown to bind the YM domain, but not the WM domain from dystrophin or to a panel of 1813 domains. The WM domain is a mail functional domain. Its name is derived from the observation that two tryptophan residues, one in the amino terminal portion of the WM domain and one in the carboxyl terminal portion, are conserved. Most proteins containing WM domains have a function involving cell signalling and growth regulation or the organisation of the cytoskeleton. Polypeptides containing a WM domain are identified by treating a multivalent recognition unit complex that has selective binding affinity for a WM domain, with many polypeptides and identifying those with selective affinity for the complex. Proteins containing WM domains are used for targeted drug screening, i.e. to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to neurotrophic low molecular weight, small molecule peptidic cyclophilin inhibitor compounds having an affinity for cyclophilin-type immunophilins, and their use as inhibitors of the enzyme activity associated with immunophilin proteins, particularly peptidyl-prolyl isomerase, or rotamase, enzyme activity. Tetrapeptide and pentapeptide combinatorial libraries were used to map the substrate specificity of the enzyme cyclophilin. Pools of tetrapeptide and pentapeptide substrates were generated and their potencies in binding to cyclophilin A were evaluated by examining the inhibition of peptidyl-prolyl isomerase activity. Positional scanning thechnique was used to determine the optimal amino acid(s) for each position of the tetra- or penta-peptide. The present sequence represents one of the peptide pools

                                                                                                                                                          The sequence is that of a peptide fragment of SERK, a putative receptor Kinase. SERK may be used as part of a method of producing appointing seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenisting the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                        of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed propagated hybrids and could shorten and simplify the breeding process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .;

The present invention describes nucleotide compounds of formula (I): 0.4°CO-R1(NH-W2).NH(CO-CHR2-NR3)m-W1 (I) 0.8 mono or oligonucleotide; V = C triple bond C-(CH2)nNH or CH=CH(CH2)n2NH; nl, n2, m = integer; R1 = trivalent group; R2, R3 = H or hydrocarbyl; or CHRZNR3 = a ring; W1, W2 = fluorescent group. Also described is the use of RNA polymerase and a mono or oligonucleotide compound (I') as initiator in a chain terminator method for DNA base sequencing. (I') has: (i) a 5'-phosphate group; and (ii) two reporters capable of serving as a donor and an acceptor in energy transfer. (I') including (I) have improved uptake efficiency by RNA polymerases and can so be used with RNA polymerases as terminators in DNA base sequencing methods. The present sequence represents a peptide used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cell migration, Ena/VASP; wound healing; actin polymerisation; neurodegeneration, Alzheimer's disease; Down Syndrome; trauna; stroke; Parkinson's disease; amyotrophic lateral sclerosis; ALS; epilepsy; Huntington's disease; ALS-Parkinsonism-dementia complex; bulbar palsy; Tourettes syndrome; hypoglycaemia; hypoxia; Creutzfeldt-Jakob disease; Korsakoff's syndrome; lagrining; memory; brain damage; senile dementia; inflammatory disorder; arthritis; allergy; gout; organ transplant;
                                                                                                                                                                                                                                                    New nucleotide derivatives having energy transfer function - contain reporters to serve as donor and acceptor, useful in chain termination DNA base sequencing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Enabled protein; Ena; vasodilator stimulated phosphoprotein; VASP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This peptide motif is present twice in novel mouse Mena (mammalian Ena) protein (see AAW37148) and once in novel mouse Ena-VASP-like Ev1 protein (see AAW37149). It mediates binding to the actin-monomer sequestering protein profilin. The invention relates to disclosed Mena and Ev1 genes (see AAW02966-98) and proteins (see AAW37148-53), and a variety of methods and compositions used for screening, isolating and characterising endogenous and exogenous factors, drugs and therapeutic agents useful to evaluate and/or control cytoskeletal dynamic events involved in normal and abnormal cell morphology, adhesion, motility, growth and/or differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detection of modulators of Mena and Ena-VASP-like genes and proteins - used in control of cytoskeletal dynamic events in normal and abnormal cell morphology, adhesion, motility, growth and

The invention relates to a method of preventing mammalian cell migration, comprising inducing a functional Ena(enabled)/vasodilator-stimulated phosphorotein (VASP) or promoting cell migration comprising depleting composition in vitro or in the mammalian cell. The method is useful for preventing or promoting mammalian cell migration, preferably tumour cell migration in vitro or in vivo and to prevent tumour cell metastasis; in a subject. An Ena/VASP activator or inhibitor is useful for promoting wound healing, preferably fibroblasts or nerve cells of a tissue type with the inhibitor to promote actin polymerisation and tissue formation on a scaffold. The inhibitor is also useful for preventing con a scaffold. The inhibitor is also useful for preventing on a scaffold. The inhibitor is also useful for preventing complex, progressive supranuclear palsy, ALS-Parkinsonism-dementia complex, progressive supranuclear and palsy, Pick's atrophy, Retts: crebellar degeneration, Tourettes syndrome, hypoglycaemia, hypoxia, crebellar degeneration, Tourettes syndrome, hypoglycaemia, hypoxia, crebellar desase, Creutzfeldt-Jakob disease, brain demency in a subject having or at risk of developing a learning and memory in a subject having or at risk of developing a learning and memory is such as a synapse. Ena/VASP activator is useful for disrupting the activity of Mema in a synapse. Ena/VASP activator is useful for disrupting the activity of Mema in a synapse. Ena/VASP activator is useful for alisting the activity of memory in a mount for inhibiting the activity of memory and memory in a mount for inhibiting the activity of memory and me
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                disorders such as arthritis, allergy, gout, organ transplant, ulcerative collitis and ischaemic diseases and also for treating cancer metastasis. The present sequence represents the amino acid sequence of Ena/VASP homology (EVH) proline-rich motif #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protein-FE65 interaction. Inducing the activity of Ena/VASP protein in immune or haematopoietic cells reduces the ability of the cells to migrate and this is useful for treating and preventing inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                    bγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           human immunodeficiency virus infection; HIV; toxin; antiviral agent; retroviral infection; anti-HIV; virucide activity; viral protease.
                                                                                                                                                                                                                                                                                                                                                          regeneration, treating, neurodegenerative disease and metastasis, inducing or depleting a functional enabled/vasodilator-stimulated
                                                                                                                                                                                                                                                                                                           Regulating cell motility for promoting wound healing and tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0;

from a viral protein. This domain promotes the release of viral proteins from a viral protein. This domain promotes the release of viral proteins from membranes and is used as part of a fusion protein. The invention relates to a movel Loxin (e.g., ricin) based antiviral agent which is toxic to virus-infected cells, but non-toxic to uninfected cells. The invention has anti-HIV and virucide activities. Its mechanism of action is through inactivation of cellular ribosomes and enhancement of binding of the antiviral agent to galactose residues on cell surfaces, and its cellular internalisation. The invention is useful for treating human immunodeficiency virus infection and other viral infections, especially retroviral infections. The antiviral agent is activated in viral particles or early-stage infected cells, killing the cells upon infection and effectively preventing the integration of the viral genome into the host genome thereby preventing the latency/rebound problem. The agent cells all HIV susceptible cells, and not just cells known to act as host cells for the virus. The antiviral agent remains inert in a cell until cells in the virus, where the
                                                                                                                                                                                                                                                                           Novel composition comprising toxin e.g., ricin based antiviral compound useful for treating viral infections such as human immunodeficiency virus infection.
                                                                                                                                                                                                                                                                                                                                                                                         The sequence relates to the amino acid sequence of an "L domain" taken

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes a nucleic acid molecule, comprising a polynucleotide encoding 5 contiguous amino acids of a naturally-occurring adenovirus (Ad) polypeptide, where the polynucleotide is not a naturally-occurring adenoviral nucleotide sequence and is useful for creating complementing cell lines that enable the efficient production of high titer Ad vectors. The nucleic acid molecule is useful for creating Ad-complementary cell lines which are useful for high yield production of recombinant replication-incompetent Ad vectors, in the absence of detectable replication competent Ad. The adenoviruses free of contamination with RCA are suitable for preclinical and clinical use. El-deleted viruses are suitable for applications in which transgene expression is therapeutic (e.g. p53 gene transfer in cancer, beta-interferon gene transfer in cancer, platelet derived growth factor (PDGF) gene transfer in wound healing, and vascular endothelial growth factor (VBGF) gene transfer in wound healing, and vascular endothelial growth factor (VBGF) gene transfer in vascular diseases of the heart and limbs). The present sequence encodes a human Ad5 Elb 8.3 kbb protein. It is used to construct an El complementation element, for use in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ó;

peptides have immune response modulatory activity, and are capable of inducing cytokines. Colostrinin and its derived peptides are useful for inducing cytokines coduction, for modulating an immunological response and for inducing blood cell proliferation. The peptides are useful in the treatment of disorders of the central nervous system, neurological disorders, mental disorders, dementia, neurodegenerative diseases, Alzhelmer's disease, motor neurone disease, psychosis, neurosis, chronic disorders of the immune system, bacterial and viral infections and acquired immunological deficiencies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention provides the sequences of a number of peptides found in ewe's colostrinin. Colostrinin is the proline-rich polypeptide fragment of colostrum. These peptides can be used in the treatment of central nervous system disorders such as senile dementia, parkinson's disease, Alzheimer's disease, psychosis and neurosis, immune system disorders such as bacterial and viral infections, to improve the development of a child's immune system, as a dietary supplement, and to promote the dissolution of beta-amyloid plaques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Protection, endogenous therapeutic peptide; peptidase; conjugation, blood component; modification; succinimidyl; maleimido group; amino; hydroxyl; thiol; hormone; growth factor; neurotransmitter.

                  stress level in a cell or a patient, comprising contacting the cell with, or administering to the patient, an oxidative stress regulator selected from colostrinin, or its constituent peptide (e.g. the present peptide), to change the level of an oxidising species in the cell. The method can be used to treat oxidative damage to skin, by decreasing or preventing an increase in the level of damage to a biomolecule of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for promoting neural cell differentiation and treating damaged neural cells, using colostrinin and colostrinin constituent peptides (e.g. the present peptide) as a neural cell regulator. Colostrinin is a polypeptide complex found in colostrum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of colostrinin, its constituent peptide or analog as a neural cell regulator, for promoting neural cell differentiation and treating damaged neural cells in a patient
The present invention relates to a method for modulating the oxidative
                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Neuroprotective; neural cell differentiation regulator; colostrinin;
                                                                                                                                                                                                                                                        ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  comprising a therapeutically active amino acid region (III) and a reactive group (III) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (III) and a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids.

(I) are useful for modifyling therapeutic peptides o.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as a drug candidates as they require frequent administration due to rapid degradation by peptidases in the body.

Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases.

C. Angologis to Abb2241 represent peptides which can be used in the axemulification of the crease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

Mosquitoes regulate trypsin and trypsin-like enzymes with this hormone to conserve metabolic energy. Other insect pests use if for the same purpose. The peptide functions as a pesticidal compound, which inhibits digestion in pests by inhibiting synthesis of pests digestive enzymes. The pesticidal compound is useful for preventing, reducing or eliminating infestation of geographical areas by an insect population such as flesh flies, fleas, sand flies, house flies and dog flies. The pesticidal compound is sapplied to pest inhabited loci of the geographical area such as the body of water inhabited by mosquito larvae, or insects such as coleopterans, lepidopterans, dipterans or blood-sucking insects of order Diptera, suborder Nematocera, family Collicidae or subfamily Culicinae,
                                                                                                                                                                                                                                                                                              New polypeptide is useful for preventing, reducing and eliminating infestation of area by pests e.g. flesh flies or mosquito larvae, optionally in combination with e.g. repellent, attractant, acaricide,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences represented by AAR80046 and AAR80048-R80059 are substrates for the novel peptidase of the invention. The peptidase hydrolyses P-P-P. and P-P and recognises the proline at the second residue from the N-terminal of a peptide to reases the N-terminal amino acid. The enzyme's activity is stimulated with MnOl2 and inhibited with orphenanthroline and 2-mercaptoethanol. The peptidase is useful for the hydrolysis of proline containing physiologically active peptidas, oligoproline and proline rich proteins in the living body, particularly in the brain of mammals. The peptidase is useful for the prevention and treatment of proline rich protein related diseases and study of cerebral
                                                                                                                                                                                                                                                                          Gaps
                                                                                        This peptide is one of 10 claimed peptides having prolyl endopeptidase inhibitory activity; the peptide is expected to be of use for the prophylaxis and treatment of dementia. The peptide can be prepared by hydrolysis of gamma-zein from corn or by standard peptide synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         140 kDa peptidase hydrolyses proline rich proteins - useful for prevention and treatment of diseases related to proline rich proteins and studies of cerebral functions
                                                                                                                                                                                                                                                                        .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences represented by AAR80046 and AAR80048-R80059 are substrates for the novel peptidase of the invention. The peptidase hydrolyses P-P-P. P-P-P. and P-P and recognises the proline at the second residue from the N-terminal of a peptide to release the N-terminal amino acid. The enzyme's activity is stimulated with MnCl2 and inhibited with o-phenanthroline and 2-mercaptoethanol. The peptidase is useful for the hydrolysis of proline containing physiologically active peptides, oligoproline and proline rich proteins in the living body, particularly in the brain of mammals. The peptidase is useful for the prevention and treatment of proline rich protein related diseases and study of cerebral

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δ
                                                                                                                                                                                                                                     Sequence 9, Application US/08477509B
Patent No. 5770697
GENERAL INFORMATION:
APPLICANT: Ferrari, Franco A
APPLICANT: Cappello, Joseph
APPLICANT: CISsman, John w
APPLICANT: Dorman, Mary A
TITLE OF INVENTION: No. 5770697el Peptides Comprising Repetitive
TITLE OF INVENTION: Units of Amino Acids and DNA Sequences Encoding the Same NUMBER OF SEQUENCES: 112
CORRESPONDENCE ADDRESS:

Patent No. 5910570
GENERAL INFORMATION:
APPLICANT: The Upjohn Company
APPLICANT: FOR U.S. PURPOSES ONLY: Elhammer, Ake P. and Homa, Fred L. TILLE OF INVENTION: A Cloned DNA Encoding a UDP-GaLNAC:
TITLE OF INVENTION: Polypeptide, N-Acetylgalactosaminyltransferase NUMBER OF SEQUENCES: 19
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Patent No. 6096512
GENERAL INFORMATION:
APPLICANT: The Upjohn Company
APPLICANT: FOR U.S. PURPOSES ONLY: Elhammer, Ake P. and Homa, Fred L.
TITLE OF INVENTION: A Cloned DNA Encoding a UDP-GaLNAC:
TITLE OF INVENTION: Polypeptide, N-Acetylgalactosaminyltransferase
NUMBER OF SEQUENCES: 19
CORRESPONDENCE ADDRESS:
ADDRESSEE: Pharmacia & Upjohn Company, Intellectual
ADDRESSEE: Property Legal Services
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
